

Vehicle Measuring Guide - Cars, Vans & SUV.

Please read and understand these instructions when measuring your vehicle for Adhesive Vinyl and perforated Vinyl. While we usually work from manufacturers' vehicle templates' there are many variations in style and model. For this reason we need accurate dimensions.

it is very important to ensure that we supply you a sign that covers the entire window. We need to ensure that the design and your information is visible. Your design is created to the dimensions you supply to us.

It's also important to remember that few vehicle windows are completely square, many are curved on all edges and wrap around the shape of the vehicle too.

For this reason we need you to measure the following:

Window Width:

- Widest measurement (usually at the bottom of the glass)
- Narrowest measurement (usually at the top)

Window Height:

- Longest measurement (usually at the center of the glass)
- Shortest measurement (usually at the sides)

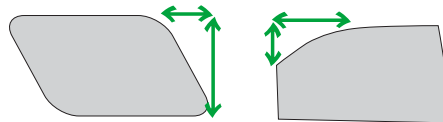

If the glass wraps around the shape significantly please also ensure the tape measure wraps around the glass too.

Wipers and Aerials

It is very important to include details and locations of any wiper arms, hinges, handles or aerials that take up any of the glass area. While the vinyl can be fitted around these things, it is important that the design/information does not run through these areas.

Side windows

When measuring side windows please remember to include widest and narrowest measurements. Also any measurements like skewed windows or curved sections (you may also like to fax a sketch to our 1 800-905-8883 number).

Wraps

In the cases of more complicated vehicle wraps and partial wraps, we will work with you to produce signage that fits your vehicle. Please call before you begin measuring your vehicle.
